SHORTCUT

activescan is

- the perfect digitalization service for the preparation of virtual product presentations

activescan offers

- the peace of mind of knowing that your product samples are digitalized in top quality
- the perfect basis for virtual product presentations (e.g. with webview)
- an altogether astonishing price-performance ratio

WHEN VIRTUAL FEELS AS GOOD AS THE REAL THING

Each process has one or even several interface points at which the overall result is influenced. Anything missed here, will invariably affect the end result.

One of the most critical interface points for virtual product presentations is the scanning of product samples, i.e. textiles, paints, or floor coverings. This is where premium technology and know-how are vital ingredients for the creation of excellent data material. Only then can color nuances, structures, and surface textures be applied 1:1 to a virtual 3D image.

We here at active online know how important the scan process is. That is why we have integrated

the process as part of our portfolio under the name activescan.

activescan stands for excellent results and clearly structured workflows. The hardware and software we use is FOGRA certified, and represents the current state of technology in the area of digitalization. You will benefit further from optimized efficiency, as we carry out the entire value-added process right here in-house.

TOP SERVICE MEETS TOP TECHNOLOGY

The degree of quality you should aim for depends primarily on your own requirements and the purpose for which the data is to be used. Scans are available in various levels of quality, and also as detail scans.

In any case: You can rely completely on our competence – for example when it comes to matching the digitalization settings to a specific material texture.

Aside from the obvious quality advantage, activescan also delivers an impressive price-performance ratio: Once we have determined your exact requirements with regards to color adjustment and resolution within a personal consulting meeting, we will then generate your data exactly how you need them and at very attractive prices.

Just another note on technology: active online uses a contactless large format scanner for the digitalization of formats up to 1.4 x 2.4 m. Twelve separate lighting settings ensure even and product-specific lighting for optimal structure displays and the best possible image sharpness. Spectral scanning allows us to implement professional color adjustments right down to hard proof quality faster and therefore more cost-effectively.
